

Cost analysis of water quality standards Presentation to Minnesota Legislative Water Commission June 15, 2017

Study purpose and scope

Engineering analysis to determine community costs related to compliance with current and future water quality regulations

Study purpose and scope

Request from legislature

- 1. Study representative sample of at least 15 communities
- 2. Estimate costs to upgrade infrastructure to meet current/ future water quality standards
- 3. Estimate incremental change in water quality resulting from upgrades

Water quality standards investigated

- Total suspended solids
- Chloride
- Nutrients (phosphorus and nitrogen)
- Nitrate (future)
- Sulfate (future)
- Ammonia (current/future)*

1. Study diverse, representative sample of communities

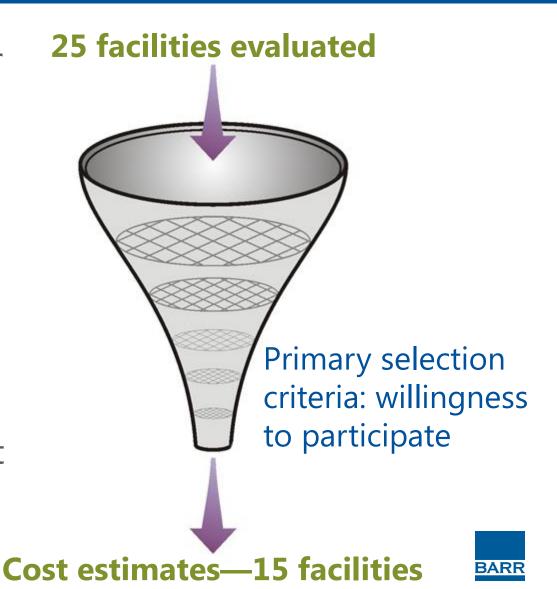

Methodology

- Identified applicable current/future water quality standards
- 2. Gathered data about facilities/water bodies and calculated effluent limits
- Evaluated which wastewater treatment technologies would be needed to meet limits
- 4. Estimated costs for wastewater treatment facility upgrades to meet current and proposed standards (15 facilities)

Methodology (continued) Evaluated <u>stormwater</u> infrastructure and costs required to meet water quality standards

 Examined incremental downstream water quality impacts of:

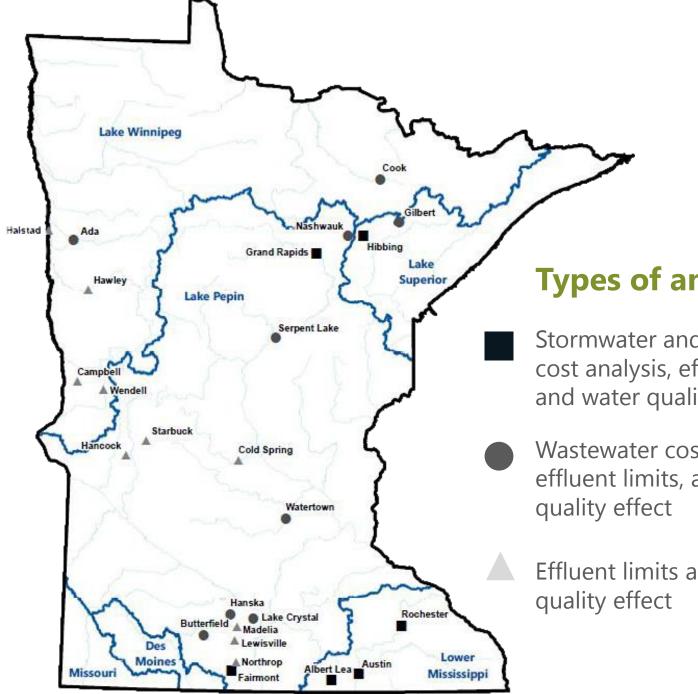

Implementing recommended wastewater infrastructure upgrades (25 facilities)

Implementing recommended stormwater infrastructure upgrades (6 cities)

Case study locations

Stormwater and wastewater cost analysis, effluent limits and water quality effect

Wastewater cost analysis, effluent limits, and water

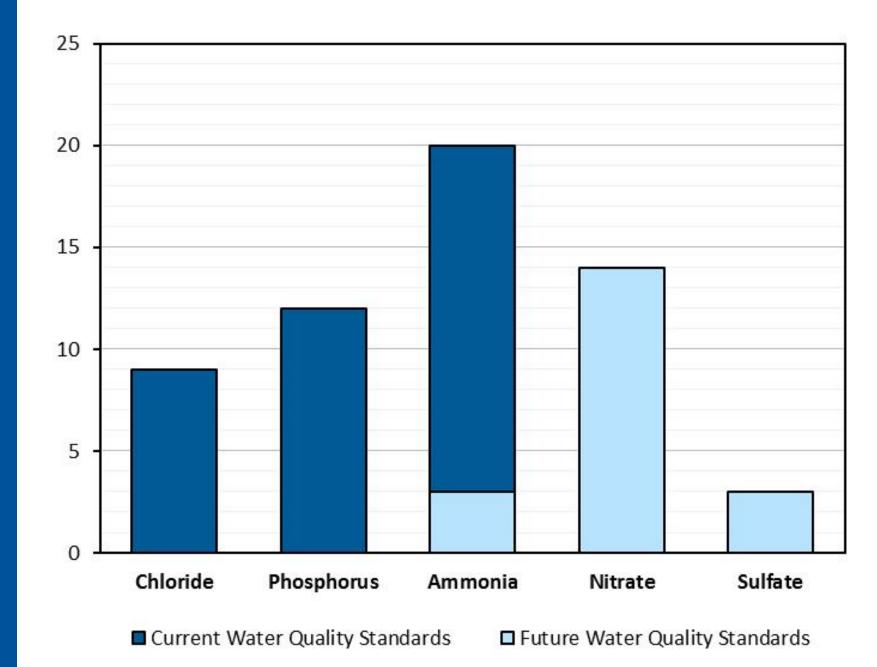

Effluent limits and water

2. Estimate infrastructure upgrade costs to meet current/future water quality standards

Number of cities with new or more stringent limits

BARR

Three types of treatment

Pond System

Total suspended solids

Some phosphorus

Some ammonia

Secondary Treatment

Total suspended solids

Phosphorus

Ammonia

Nitrate

Membrane Filtration

Total suspended solids

Phosphorus

Ammonia

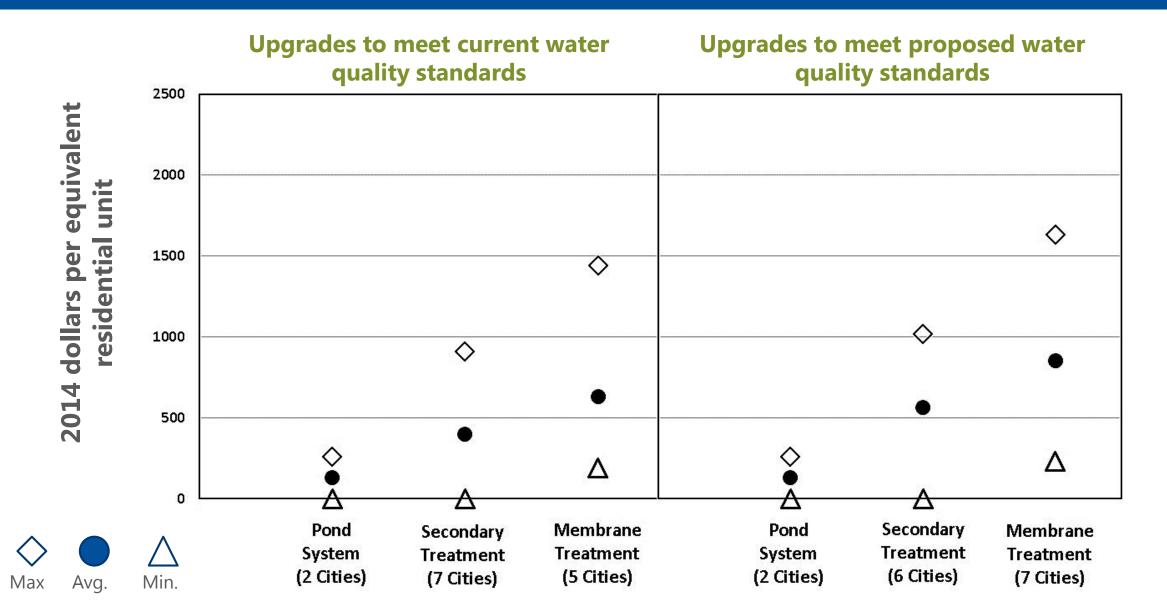

Nitrate

Chloride

Sulfate

Annual increases in user costs for upgrades

BARR

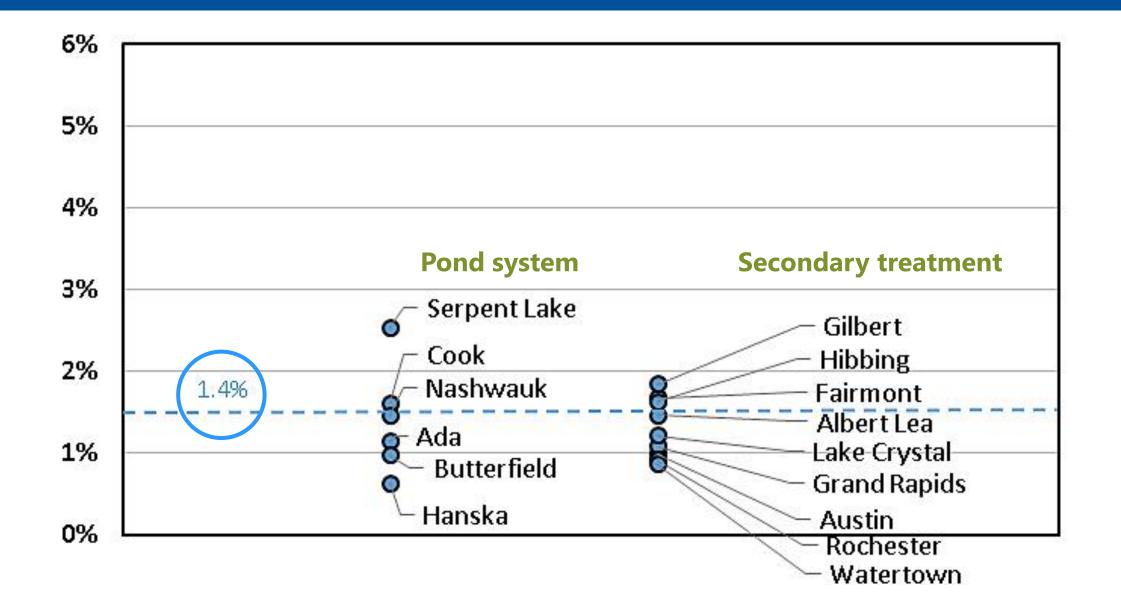

Affordability index

AFFORDABILITY: Annual sewer cost ≤ 1.4% of median household income

The Minnesota Public Facilities Authority offers grants for wastewater projects when the annual sewer cost to each household exceeds 1.4% of median household income. The Minnesota Pollution Control Agency refers to this value as the **"affordability index."**

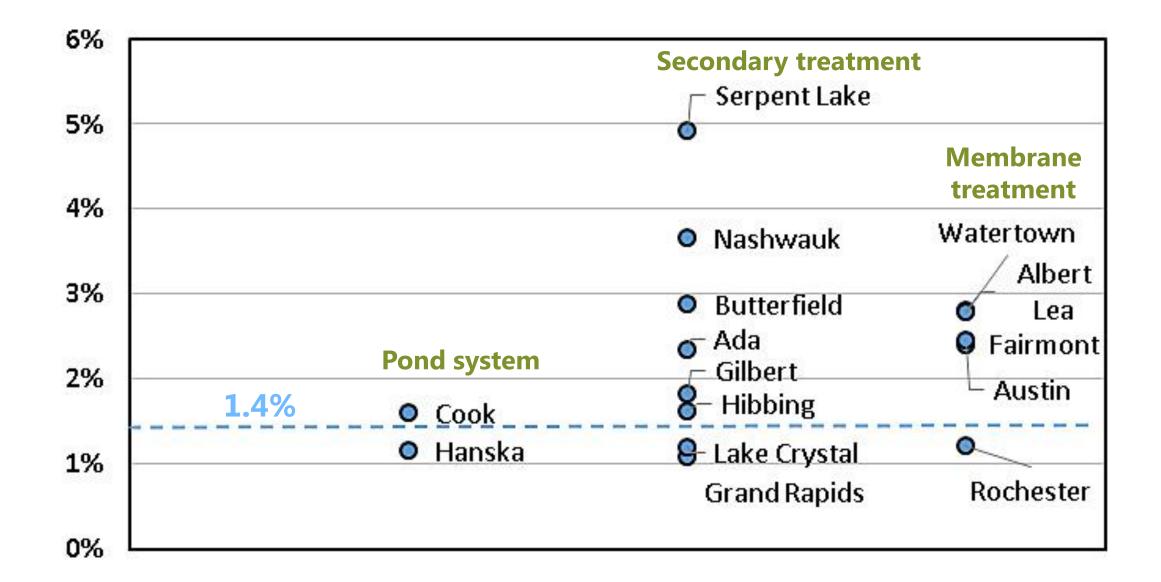

Existing sewer rates as percentage of median household income

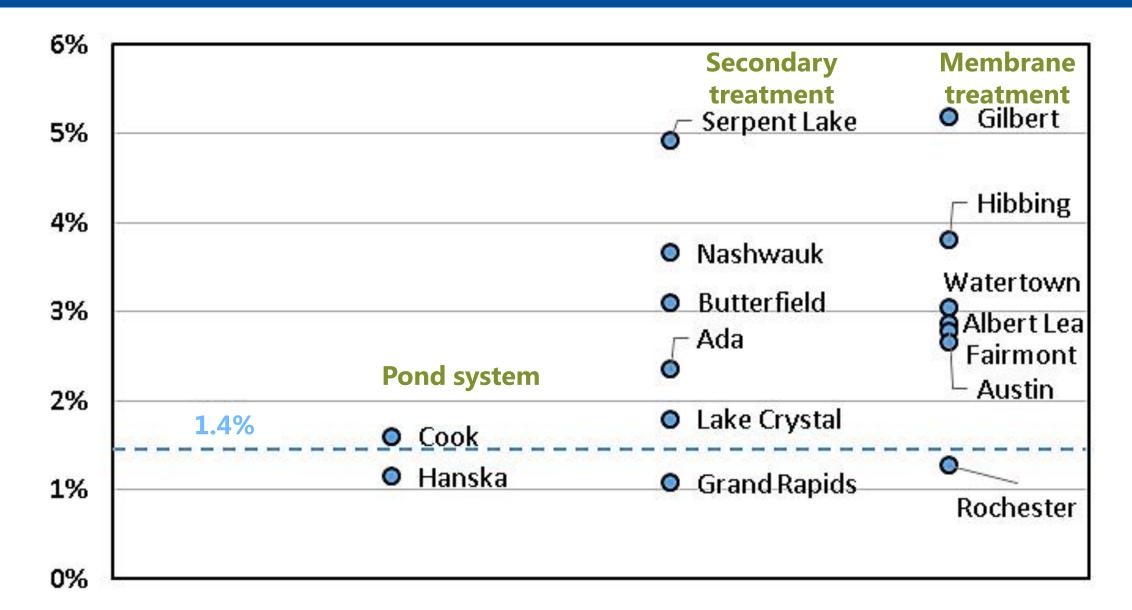

BARR

Estimated sewer rates with upgrades to meet <u>current water quality</u> <u>standards</u> (percentage of median household income)

Estimated sewer rates with upgrades to meet <u>future water quality</u> <u>standards</u> (percentage of median household income)

Anticipated sewer rates

Affordability index = ≤1.4% of median household income

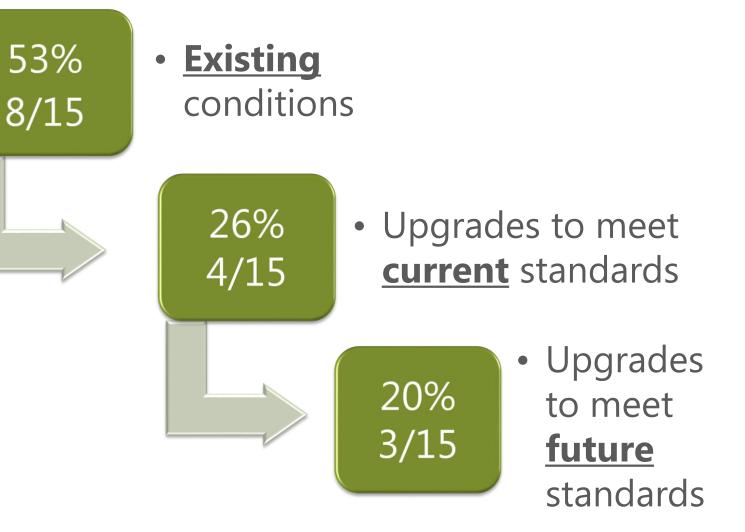

- **Existing** rates in 15 cities studied: **0.6–2.6%** of median household income
- Rates following upgrades to meet <u>current</u> water quality standards: 1.1–4.9%
- Sewer rates following upgrades to meet
 <u>future</u> water quality standards: 1.1–5.2%

Increased pressure on funding sources

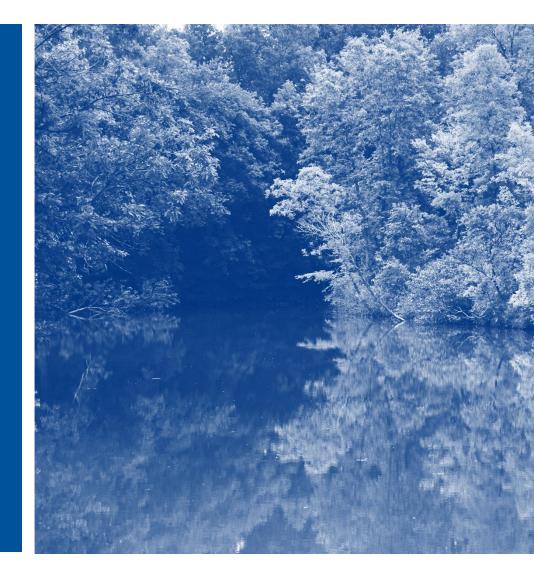

Wastewater project affordability for cities evaluated

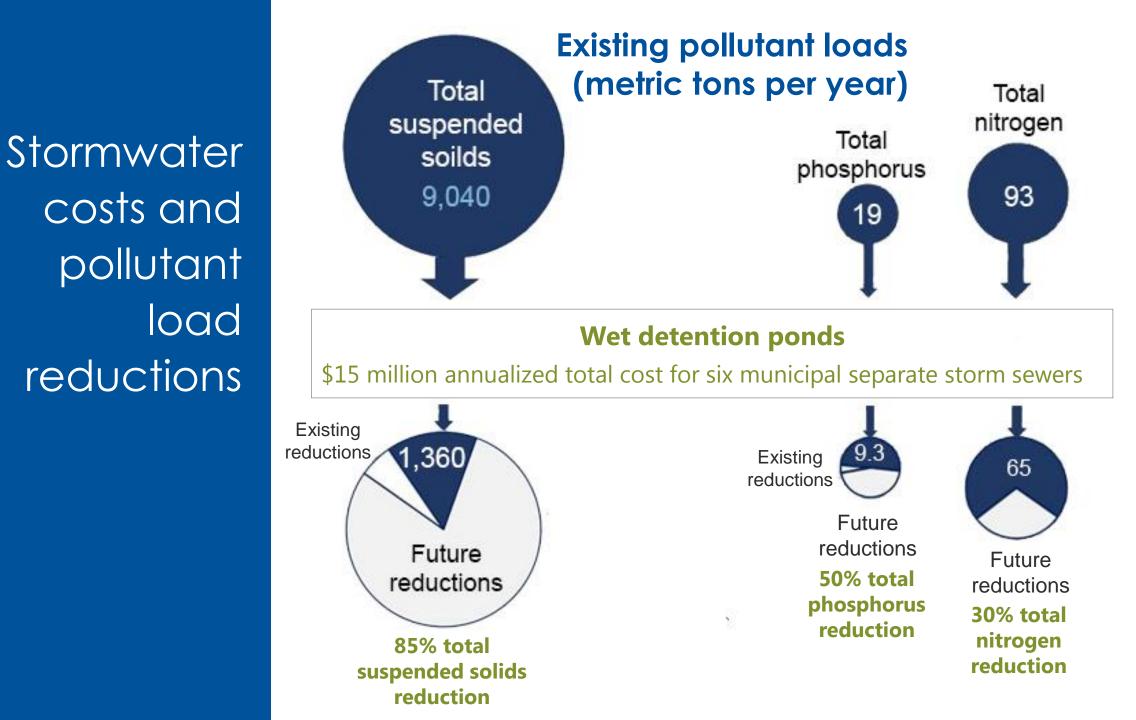

3. Stormwater costs and estimate incremental change in water quality resulting from wastewater treatment and stormwater upgrades

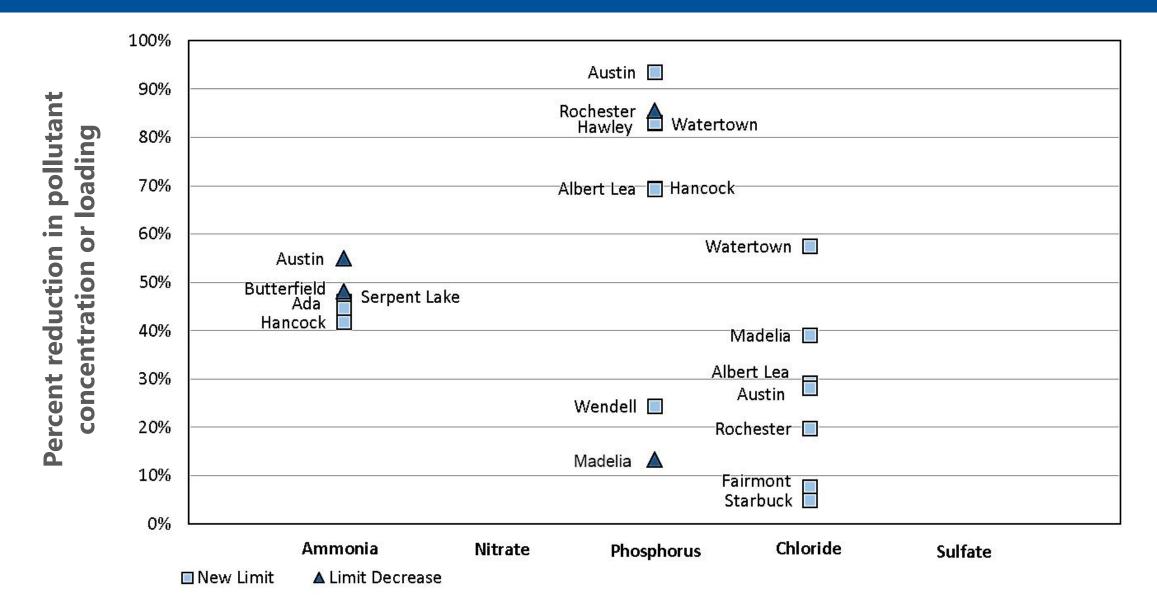

BARR

Pollutant reduction in wastewater treatment facility discharge resulting from upgrades to meet effluent limits from <u>current water quality standards</u>

Pollutant reduction in wastewater treatment facility discharge resulting from upgrades to meet effluent limits from **<u>future water quality standards</u>**
